

Round 6 · quantify a limitation, then change the certificate

Exact global-moment bounds and complete finite codeword lists; no exceptional-set or prize theorem.

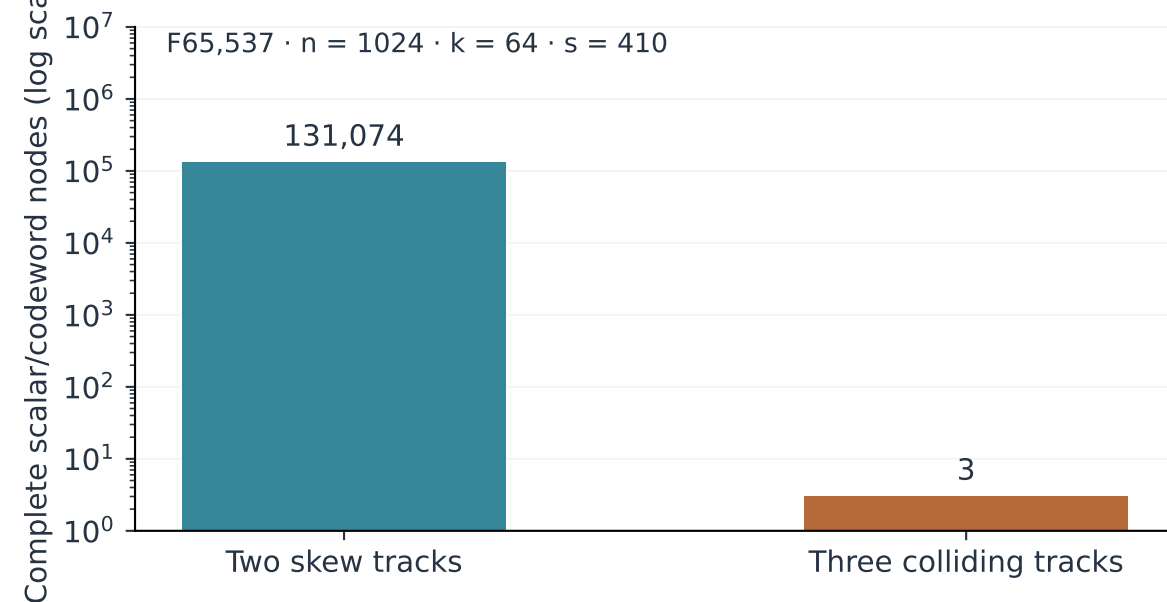

A A finite-size trend becomes an exact law

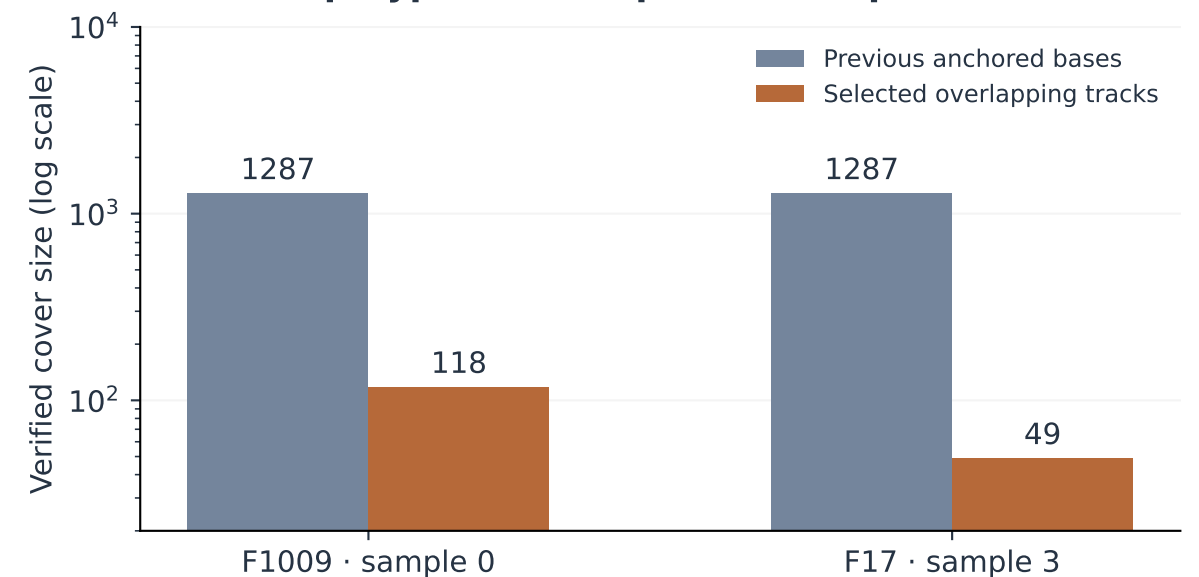

B Lost arithmetic information has a small effect

C Exact lists without a codeword anchor

D Overlap bypasses the partition-cap barrier

A: enclosure widths are too small to display; new $q = 6,700,417$ and $2,013,265,921$ require no character array.

B: nonnegative histogram relaxations, not constructed graph pairs. D: both toy covers are complete; pure k -support cover size is exponential at fixed rate.
