

# Round 5 · exact compression, hidden-piece discovery, and limits

Independent finite checks; global moments and ordinary codeword lists, without prize-proof claims.

## A Constant algebra budget

## B Extra moment distinguishes actual twins

## C That ordering does not order maxima

## D Discovery makes a list certificate possible

D uses structured interleaved inputs with  $n = 1024$ ,  $k = 64$ . All 16 saved hard coset stacks remain unresolved by discovery. A excludes inventory construction. B-C use complete order49 censuses through  $n = 8$  (450,978,066 subsets per graph).
